

implement A user login & signup Feature where required data for registration are [ fullName - Email - Phone - Password - ID Document ]

- The user Should be able to register using the previous data and upload his ID Document
- There Should Be A verification Email Sent to user's email once registered , when the user follows verification link , the user should be verified
- User should not be able to login if his account is not verified
- User should login with email and password
- There should be a validation layer that validates signup , For example ( user should enter his phone like +201000000 not 010 , also for email )

**Note :** Create A New Public github Repo & deploy your backend in render + provide Postman Collection For Required APIs

Provide us the github repo link
